Dayyaan Francis 222277343- Reflection – Forge Fitness Project

Throughout this project, I was mainly responsible for the development and design of the Homepage and About Us pages for the Forge Fitness application. My role focused on helping create a user-friendly interface that introduces users to the gym and allows easy navigation throughout the system.

One of the main tasks I completed was designing the Homepage wireframe using Figma. I created the overall layout, including the main title, motivational slogan, navigation buttons, and feature sections. The aim of the homepage was to give users a clear understanding of what Forge Fitness offers while maintaining a simple and organized design. I also ensured that the design matched the visual style used by the other group members so that the application remained consistent.

In addition to the Homepage, I also contributed to the About Us page with assistance from Adriaan van der Westhuizen. This page was designed to provide users with background information about Forge Fitness, its goals, and its purpose. Working together on these pages helped improve collaboration within the group and allowed us to share ideas regarding the layout and user experience of the application.

Another important part of the project involved creating and uploading my ERD section and business rules document to GitHub. I used my own branch within the repository to upload my contributions and manage my work separately from the rest of the group. This helped ensure proper organization and version control throughout the project.

GitHub played an important role in the project because it allowed the team to collaborate effectively and keep all project files stored in one central repository. I also shared the repository URL as part of the submission process so that the lecturer could access and review my contributions.

Throughout the project, I learned the importance of planning before starting development. Creating wireframes showed me how important layout, spacing, and navigation are when designing a user interface. I also improved my understanding of Figma by learning how to create and organize components such as buttons, text sections, feature cards, and page layouts.

Another important lesson I learned was the importance of teamwork and communication in software development projects. The group regularly communicated through WhatsApp and collaborated on tasks to ensure the project continued progressing. GitHub also played an important role in allowing us to upload and manage our work efficiently.

One challenge I experienced during the project was trying to make the Homepage design look visually complete while still keeping it simple and consistent with the rest of the

group's wireframes. To overcome this, I made several improvements to the layout by adding feature sections, buttons, and design elements that improved the overall appearance of the page.

Overall, this project helped me improve both my technical and teamwork skills. I gained practical experience in wireframing, UI design, collaboration, GitHub version control, and project organization, all of which are important skills in real-world software development.
