Forge Fitness – Individual Submission

Name: Dayyaan Francis
Student Number: 222277343
Project: Forge Fitness Web Application

1. Introduction

Forge Fitness is a gym management web application designed to help users access fitness services such as training plans, packages, courses, and trainer information.

2. Role in the Group

My role in the group focused mainly on the Homepage and About Us pages of the Forge Fitness application. I worked on the layout, structure, and design of these pages using Figma and collaborated with Adriaan van der Westhuizen to ensure consistency throughout the application. I also contributed to my section of the ERD diagram and business rules documentation.

3. Wireframes

Below are the wireframes I contributed to during the project.

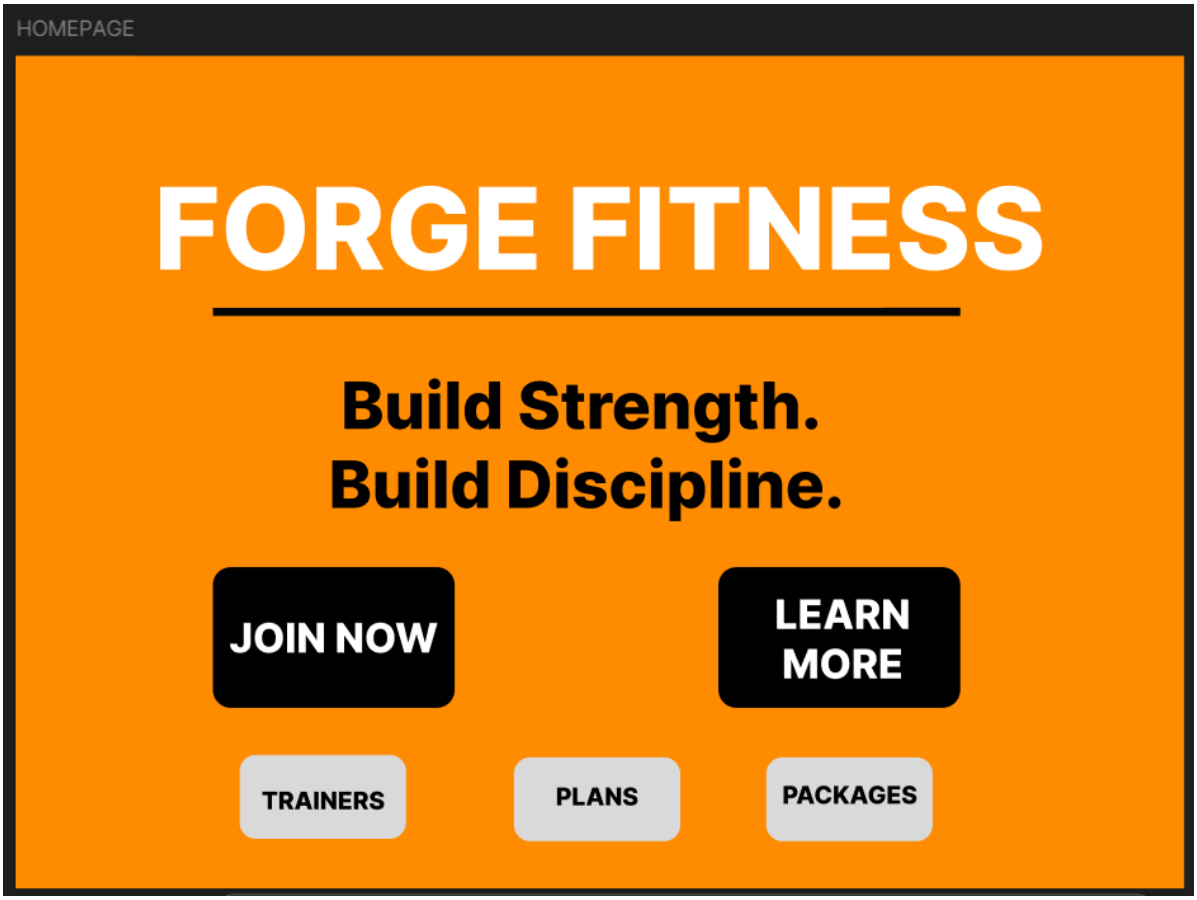

Figure 1: Homepage wireframe designed for Forge Fitness.

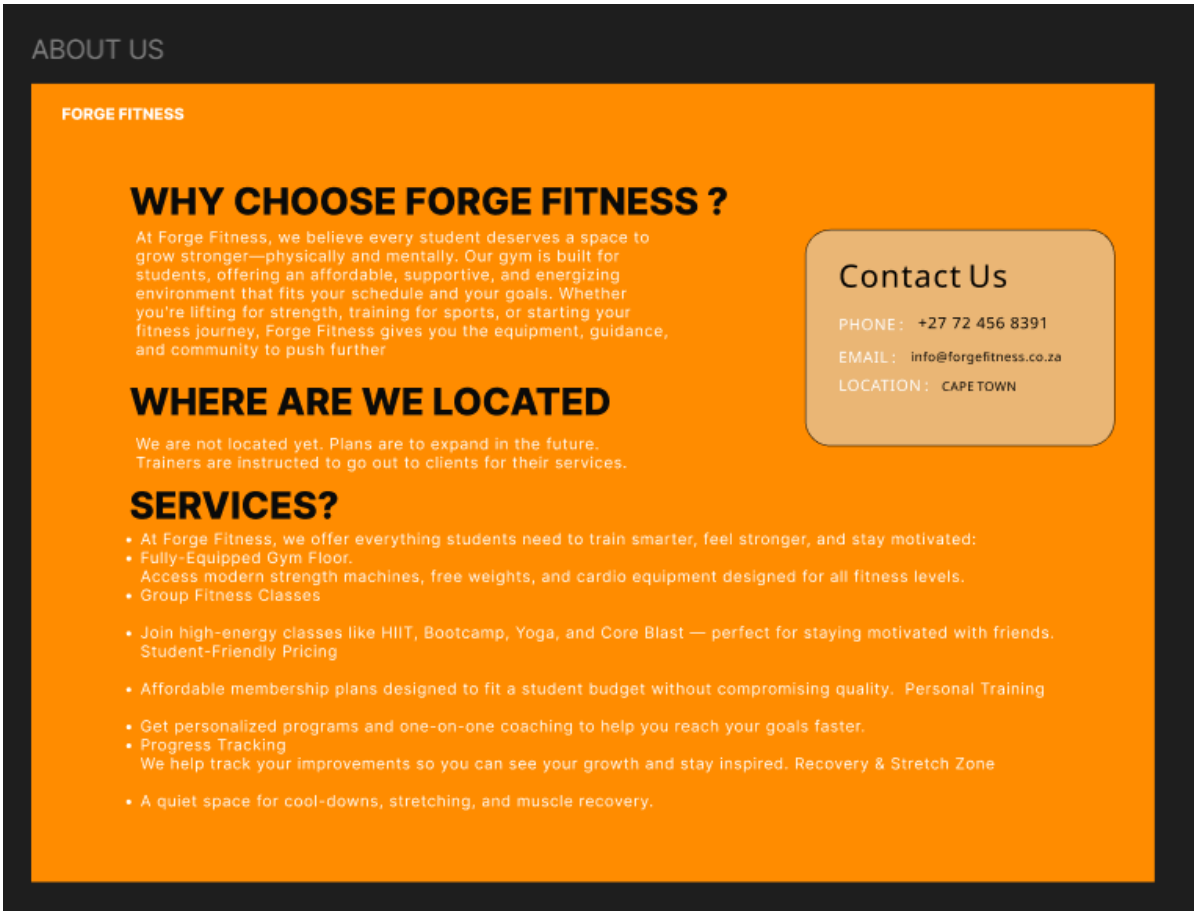

Figure 2: About Us page wireframe.

4. Business Rules

The following business rules were developed for the Forge Fitness system:

- 1.1 A new member should provide their ID for verification and create a password.
- 1.2 Passwords must meet the system security requirements.
- 1.3 Users may only access member-only features when their membership is active and verified.
- 2.1 Users must be registered and verified members to access memberships.
- 3.1 Only verified and registered members can buy packages.
- 4.1 Course content should be evaluated before being published.
- 4.2 Each course should have a title and description.

My contribution focused mainly on Business Rule Section 4 related to Courses within the system.

5. ERD Diagrams

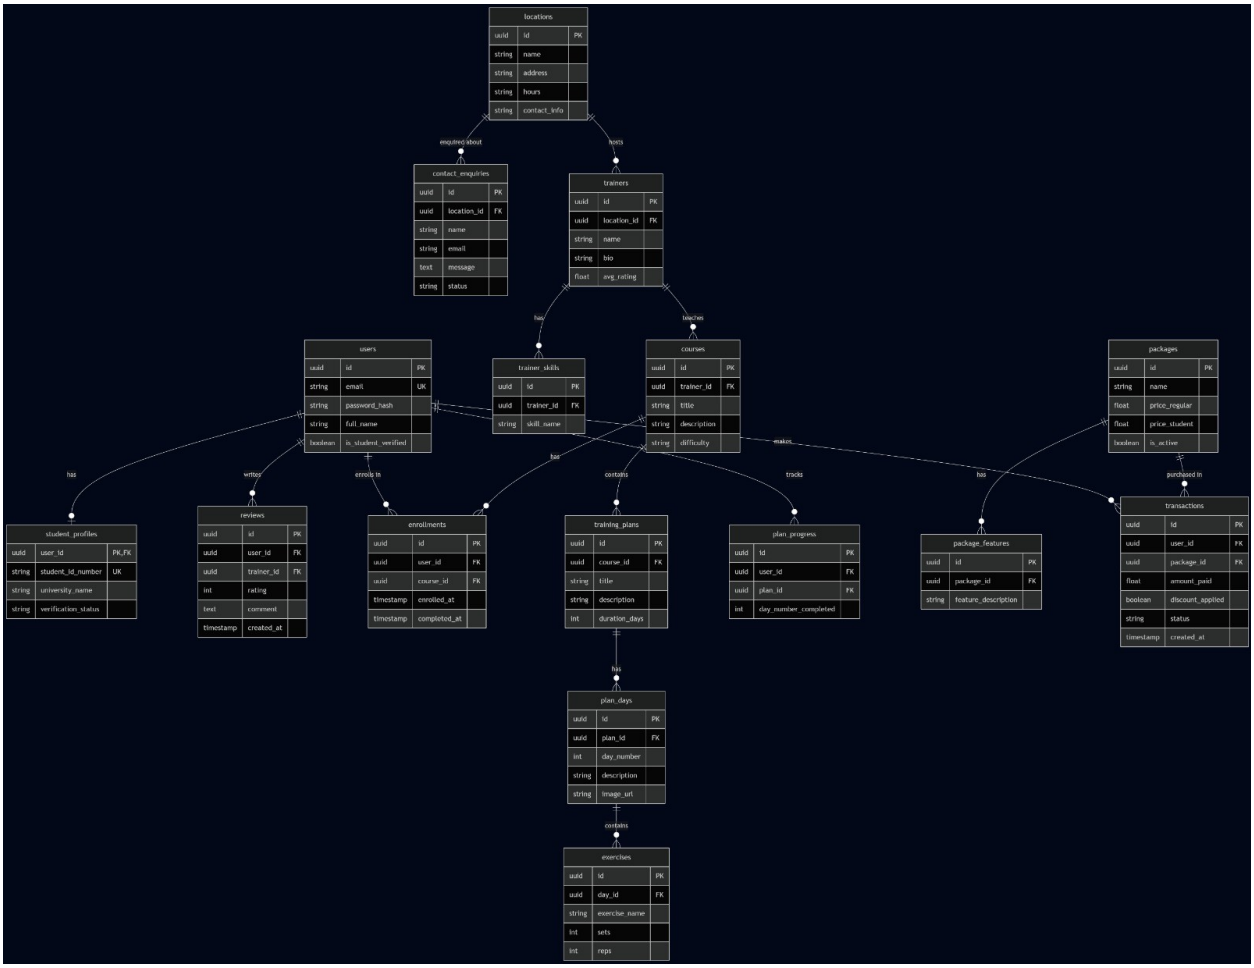

Figure 3: Overall ERD diagram for Forge Fitness.

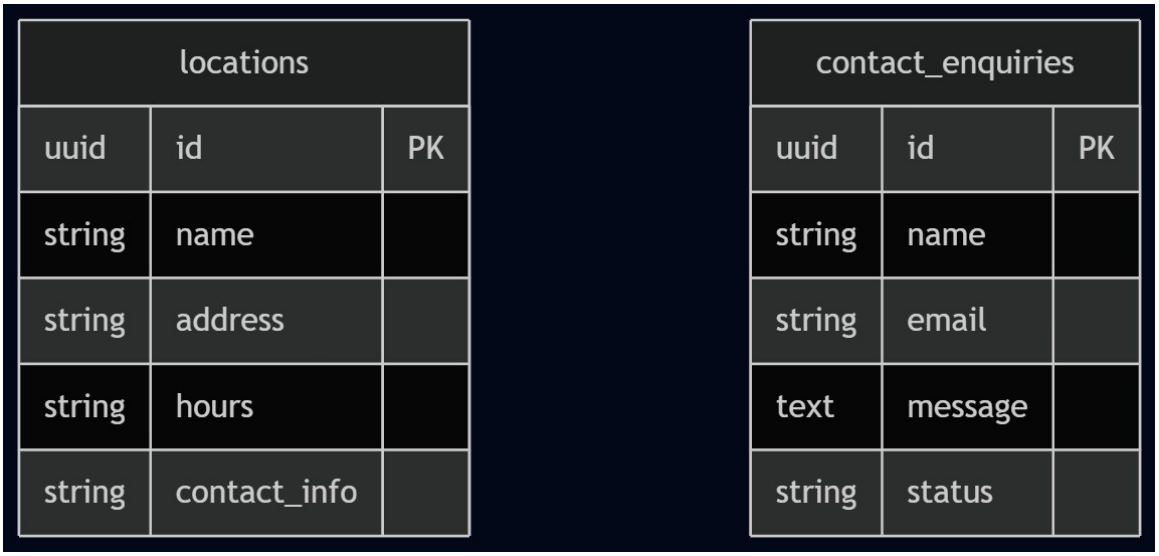

Figure 4: Individual ERD contribution.

My ERD contribution focused mainly on the Locations and Contact Enquiries entities. This section also links to Trainers (Module 3), where each trainer is assigned to a location. Locations are displayed on the Homepage and About Us pages to help users find gym branches and trainer information.

6. GitHub Contribution

GitHub was used throughout the project to manage files and collaborate as a group. I uploaded my ERD diagrams, business rules, wireframes, and reflection documents to my individual branch.

7. Reflection

Throughout this project, I improved my understanding of teamwork, communication, and UI design. Working in a group environment taught me the importance of collaboration and keeping consistent communication throughout the development process. I also gained more confidence using tools such as Figma and GitHub, which helped improve my technical skills and understanding of software development workflows.

One challenge I experienced was balancing simplicity with design quality when creating the wireframes. I learned that even simple layouts require proper spacing, structure, and organization to create a good user experience. The project also helped me better understand how database structures and business rules connect to the overall functionality of a system.

Overall, this project gave me valuable practical experience in collaborative development, project organization, and problem-solving within a software development environment.

8. Conclusion

The Forge Fitness project provided valuable experience in collaborative software development, wireframing, GitHub version control, and database design.
